

Success Story: Healthcare Organization solves Network Saturation issue impacting VDI users

Background

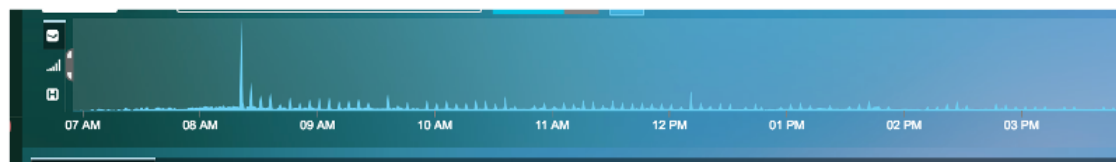

- Mid-size health group located in the United States.

Challenges/Needs

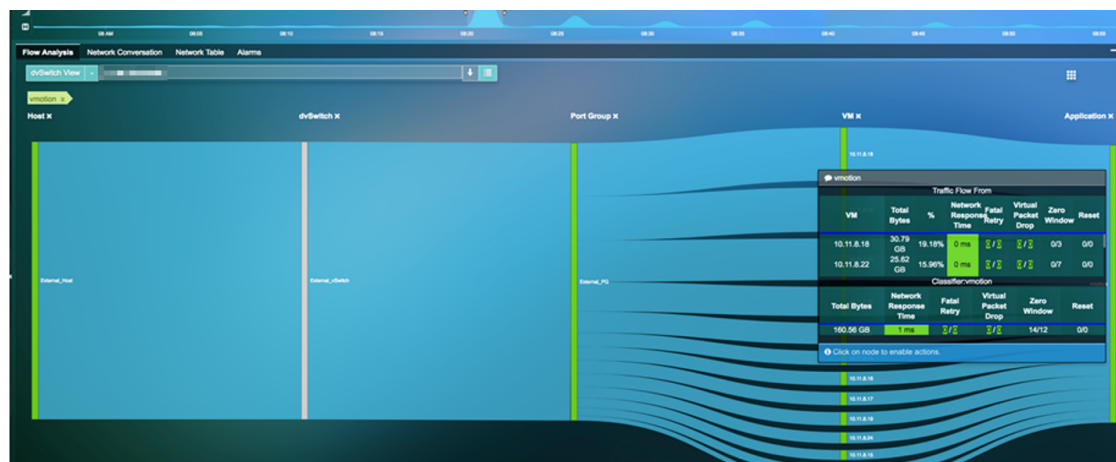

- Desktop IT team received complaints from VDI users on slow access to their applications everyday between 8 am and 9 am.

Uila Solution

- The Desktop team using Uila was quickly able to see network traffic spikes during that time period.

- Using Uila's built-in application classification and network flow analysis of the virtual traffic, the desktop team was able to pinpoint the root cause to the VMware vSphere® vMotion® traffic. By changing the configuration settings for the same, the team was able to manage a good balance between vMotion activities and the performance impact to the VDI users

Uila Benefits

With Uila, the Desktop IT team was able to resolve the issue quickly and eliminate any impact to employee productivity for the organization.
